Swap

App Kit: Swap

Copy page

Swap stablecoins and native tokens on the same blockchain with App Kit's Swap capability

App Kit includes the Swap capability that lets you swap two tokens on the same blockchain in a few lines of code. If you only need to swap and don't want the full App Kit, you can install the Swap package on its own. You need a (free) kit key from Circle Console to use Swap.

> Among testnets, only Arc Testnet supports Swap (USDC and EURC only). Use mainnet for Swap on any other blockchains.

Quick look

This example swaps USDC for EURC in a single method call:

TypeScript

```
// Swap 1.00 USDC for EURC on Arc Testnet
const result = await kit.swap({
  from: { adapter: viemAdapter, chain: "Arc_Testnet" },
  tokenIn: "USDC",
  tokenOut: "EURC",
  amountIn: "1.00",
  config: {
    kitKey: process.env.KIT_KEY as string, // Your kit key from the Circle Con
  },
});
```

Installation

App Kit comes with the Swap capability installed by default. If you've already installed App Kit, you can skip this section. If you only need to swap and don't want the full App Kit, you can install just the Swap package.

Install the Swap package and the adapter that matches your environment:

Viem Ethers Solana Circle Wallets

npm yarn

```
npm install @circle-fin/swap-kit @circle-fin/adapter-viem-v2 viem
```
