Build with AI

Arc MCP server

Copy page

Connect your AI coding tools to Arc documentation using the Model Context Protocol (MCP) server for search and full-page retrieval.

The Arc Model Context Protocol (MCP) server gives AI tools direct access to Arc documentation so they can search for relevant content and retrieve full pages during conversations. It is hosted at `https://docs.arc.network/mcp` and requires no authentication.

The server exposes two tools:

- **Search** — finds relevant documentation snippets based on a query.
- **Get page** — retrieves the full content of a specific documentation page.

For a machine-readable index of all documentation pages, see the `llms.txt` **file**.

Claude Code

Run the following command to add the Arc MCP server:

```
claude mcp add --transport http arc-docs https://docs.arc.network/mcp
```

Claude Code automatically discovers the server's tools on the next conversation.

Claude Desktop

1. Open **Settings** and navigate to **Connectors**.
2. Select **Add custom connector**.
3. Enter `Arc Docs` as the name and `https://docs.arc.network/mcp` as the URL.

4. During a chat, use the attachments button to select the Arc Docs connector.

Cursor ›

Add the following to your `mcp.json` file (accessible via **Cursor Settings > MCP**):

```
{
  "mcpServers": {
    "arc-docs": {
      "url": "https://docs.arc.network/mcp"
    }
  }
}
```

VS Code (Copilot)

Create or update `.vscode/mcp.json` in your project root:

```
{
  "servers": {
    "arc-docs": {
      "type": "http",
      "url": "https://docs.arc.network/mcp"
    }
  }
}
```

Windsurf

Add the following to your Windsurf MCP configuration:

```
{
  "mcpServers": {
    "arc-docs": {
      "serverUrl": "https://docs.arc.network/mcp"
    }
  }
}
```

Other MCP clients

Any MCP-compatible client can connect using the HTTP transport at `https://docs.arc.network/mcp`. Most clients require only the server URL and transport type (`http`). Refer to your client's documentation for the exact configuration format.

Verify the connection

After adding the server, confirm the connection by asking your AI tool a question about Arc, such as "What smart contract standards does Arc support?" The tool should return content sourced from Arc documentation. If it does not:

- **Check the URL** — confirm it is exactly `https://docs.arc.network/mcp` with no trailing path.
- **Check network access** — the server must be reachable over HTTPS from your machine.
- **Restart the client** — some tools only detect new MCP servers after a restart or new session.
