Network

Gas and fees

Copy page

How gas and transaction fees work on Arc, including the base fee model, pricing mechanics, and configuration guidelines.

Arc uses USDC as the native gas token for stable transaction costs. The Arc Testnet enforces a minimum base fee of 160 Gwei, targeting roughly $0.01 per transaction.

Gas mechanics

Key	Value
Unit	USDC (18 decimals)
Pricing	EIP-1559–like base fee with exponentially weighted moving-average smoothing
Base fee (testnet)	~160 Gwei minimum
Best practice	Surface gas fees in USDC and fetch the base fee dynamically when submitting transactions

Policy overview

- The base fee is dynamically adjusted using a bounded, moving-average mechanism designed to stabilize around 160 Gwei under normal network load.
- Transactions submitted with a max fee below 160 Gwei may remain pending or fail to execute.
- To ensure timely inclusion, set `maxFeePerGas ≥ 160 Gwei` .

Monitoring

You can view real-time gas metrics and recent averages using the **Arc Gas Tracker**.

> This configuration applies to the Arc Testnet and may evolve as network parameters are tuned for mainnet launch.

For an overview of Arc's fee architecture and design principles, see **Stable Fee Design**.
