Customize bridging

How to: Collect custom bridge fees

Copy page

Configure custom fees to collect on bridge transfers

App Kit lets you collect a custom fee from your end users on each bridge transfer. For how custom fees fit into the overall fees breakdown, see **How Bridge Fees Work**.

> If you use this feature, Arc keeps 10% of the custom fee you collect from your end users.

Prerequisites

Before you begin, ensure that you've:

- **Installed App Kit**
- **Configured an adapter**

These are required so any example below runs with a valid `kit` and `adapter`.

Set a custom fee on a bridge

This example adds a 0.10 USDC fee to a single bridge transfer:

TypeScript

```typescript
// Bridge 1.00 USDC from Ethereum to Arc
const result = await kit.bridge({
  from: { adapter, chain: "Ethereum_Sepolia" },
  to: { adapter, chain: "Arc_Testnet" },
  amount: "1.00",
  // Collect a fee of 0.10 USDC on this bridge transfer
  config: {
    customFee: {
      value: "0.10",
      recipientAddress: "YOUR_WALLET_ADDRESS",
    },
  },
});
```
