Customize swapping

How to: Collect custom swap fees

Copy page

Configure custom fees to collect on token swaps

You can configure your swaps to collect a custom fee from end users on each swap call. For how custom fees fit into the overall fees breakdown, see **How Swap Fees Work**.

> If you use this feature, Arc keeps 10% of the custom fee you collect from your end users.

Prerequisites

Before you begin, ensure that you've:

- **Installed App Kit**
- **Configured an adapter**

These are required so any example below runs with a valid `kit` and `adapter`.

Set a custom fee on a swap

This example adds a 1% (100 basis points) fee to a single swap call:

TypeScript

```
const output = await kit.swap({
  from: { adapter, chain: "Arc_Testnet" },
  tokenIn: "USDC",
  amountIn: "1.00",
  tokenOut: "EURC",
  config: {
    kitKey: process.env.KIT_KEY as string,
    customFee: {
      percentageBps: 100, // 1% fee
      recipientAddress: "YOUR_WALLET_ADDRESS",
    },
  },
});
```
