Customize swapping

How-to: Estimate swap rate

Copy page

Get a pre-swap estimate of the amount to receive before swapping

You can get a pre-swap estimate of the amount you'll receive before swapping.

Prerequisites

Before you begin, ensure that you've:

- **Installed App Kit**
- **Configured an adapter**

These are required so any example below runs with a valid `kit` and `adapter`.

Estimate swap amount

This example estimates how much EURC you'll receive when swapping 1.00 USDC for EURC:

TypeScript

```
// Set up the swap
const params = {
  from: { adapter, chain: "Arc_Testnet" },
  tokenIn: "USDC",
  amountIn: "1.00",
  tokenOut: "EURC",
  config: {
    kitKey: process.env.KIT_KEY as string,
  },
};

// Estimate swap amount
const estimate = await kit.estimateSwap(params);
console.log(`Estimated output: ${estimate.estimatedOutput}`);

// Proceed to swap
const result = await kit.swap(params);
```
